

## C. Little Elephant and LCM

time limit per test: 4 seconds

memory limit per test: 256 megabytes

input: standard input

output: standard output

The Little Elephant loves the LCM (least common multiple) operation of a non-empty set of positive integers. The result of the LCM operation of  $k$  positive integers  $x_1, x_2, \dots, x_k$  is the minimum positive integer that is divisible by each of numbers  $x_i$ .

Let's assume that there is a sequence of integers  $b_1, b_2, \dots, b_n$ . Let's denote their LCMs as  $lcm(b_1, b_2, \dots, b_n)$  and the maximum of them as  $max(b_1, b_2, \dots, b_n)$ . The Little Elephant considers a sequence  $b$  good, if  $lcm(b_1, b_2, \dots, b_n) = max(b_1, b_2, \dots, b_n)$ .

The Little Elephant has a sequence of integers  $a_1, a_2, \dots, a_n$ . Help him find the number of good sequences of integers  $b_1, b_2, \dots, b_n$ , such that for all  $i$  ( $1 \leq i \leq n$ ) the following condition fulfills:  $1 \leq b_i \leq a_i$ . As the answer can be rather large, print the remainder from dividing it by 1000000007 ( $10^9 + 7$ ).

### Input

The first line contains a single positive integer  $n$  ( $1 \leq n \leq 10^5$ ) — the number of integers in the sequence  $a$ . The second line contains  $n$  space-separated integers  $a_1, a_2, \dots, a_n$  ( $1 \leq a_i \leq 10^5$ ) — sequence  $a$ .

### Output

In the single line print a single integer — the answer to the problem modulo 1000000007 ( $10^9 + 7$ ).

### Examples

|              |
|--------------|
| input        |
| 4<br>1 4 3 2 |
| output       |
| 15           |

|          |
|----------|
| input    |
| 2<br>6 3 |
| output   |
| 13       |
