

## D. Case of Fugitive

time limit per test: 3 seconds  
memory limit per test: 256 megabytes  
input: standard input  
output: standard output

Andrewid the Android is a galaxy-famous detective. He is now chasing a criminal hiding on the planet Oxa-5, the planet almost fully covered with water.

The only dry land there is an archipelago of  $n$  narrow islands located in a row. For more comfort let's represent them as non-intersecting segments on a straight line: island  $i$  has coordinates  $[l_i, r_i]$ , besides,  $r_i < l_{i+1}$  for  $1 \leq i \leq n - 1$ .

To reach the goal, Andrewid needs to place a bridge between each pair of **adjacent** islands. A bridge of length  $a$  can be placed between the  $i$ -th and the  $(i + 1)$ -th islands, if there are such coordinates of  $x$  and  $y$ , that  $l_i \leq x \leq r_i$ ,  $l_{i+1} \leq y \leq r_{i+1}$  and  $y - x = a$ .

The detective was supplied with  $m$  bridges, each bridge can be used at most once. Help him determine whether the bridges he got are enough to connect each pair of adjacent islands.

### Input

The first line contains integers  $n$  ( $2 \leq n \leq 2 \cdot 10^5$ ) and  $m$  ( $1 \leq m \leq 2 \cdot 10^5$ ) — the number of islands and bridges.

Next  $n$  lines each contain two integers  $l_i$  and  $r_i$  ( $1 \leq l_i \leq r_i \leq 10^{18}$ ) — the coordinates of the island endpoints.

The last line contains  $m$  **integer** numbers  $a_1, a_2, \dots, a_m$  ( $1 \leq a_i \leq 10^{18}$ ) — the lengths of the bridges that Andrewid got.

### Output

If it is impossible to place a bridge between each pair of adjacent islands in the required manner, print on a single line "No" (without the quotes), otherwise print in the first line "Yes" (without the quotes), and in the second line print  $n - 1$  numbers  $b_1, b_2, \dots, b_{n-1}$ , which mean that between islands  $i$  and  $i + 1$  there must be used a bridge number  $b_i$ .

If there are multiple correct answers, print any of them. Note that in this problem it is necessary to print "Yes" and "No" in correct case.

### Examples

input
4 4 1 4 7 8 9 10 12 14 4 5 3 8
output
Yes 2 3 1

input
2 2 11 14 17 18 2 9
output
No

input

2 1  
1 1  
10000000000000000000 10000000000000000000  
999999999999999999

output

Yes  
1

Note

In the first sample test you can, for example, place the second bridge between points 3 and 8, place the third bridge between points 7 and 10 and place the first bridge between points 10 and 14.

In the second sample test the first bridge is too short and the second bridge is too long, so the solution doesn't exist.
