

C. Sereja and Subsequences

time limit per test: 2 seconds
memory limit per test: 256 megabytes
input: standard input
output: standard output

Sereja has a sequence that consists of n positive integers, a_1, a_2, \dots, a_n .

First Sereja took a piece of squared paper and wrote all **distinct** non-empty non-decreasing subsequences of sequence a . Then for each sequence written on the squared paper, Sereja wrote on a piece of lines paper all sequences that *do not exceed* it.

A sequence of positive integers $x = x_1, x_2, \dots, x_r$ doesn't exceed a sequence of positive integers $y = y_1, y_2, \dots, y_r$, if the following inequation holds: $x_1 \leq y_1, x_2 \leq y_2, \dots, x_r \leq y_r$.

Now Sereja wonders, how many sequences are written on the lines piece of paper. Help Sereja, find the required quantity modulo 1000000007 ($10^9 + 7$).

Input

The first line contains integer n ($1 \leq n \leq 10^5$). The second line contains n integers a_1, a_2, \dots, a_n ($1 \leq a_i \leq 10^6$).

Output

In the single line print the answer to the problem modulo 1000000007 ($10^9 + 7$).
