

A. Xor-tree

time limit per test: 1 second

memory limit per test: 256 megabytes

input: standard input

output: standard output

Iahub is very proud of his recent discovery, propagating trees. Right now, he invented a new tree, called xor-tree. After this new revolutionary discovery, he invented a game for kids which uses xor-trees.

The game is played on a tree having n nodes, numbered from 1 to n . Each node i has an initial value $init_i$, which is either 0 or 1. The root of the tree is node 1.

One can perform several (possibly, zero) operations on the tree during the game. The only available type of operation is to pick a node x . Right after someone has picked node x , the value of node x flips, the values of sons of x remain the same, the values of sons of sons of x flips, the values of sons of sons of sons of x remain the same and so on.

The goal of the game is to get each node i to have value $goal_i$, which can also be only 0 or 1. You need to reach the goal of the game by using minimum number of operations.

Input

The first line contains an integer n ($1 \leq n \leq 10^5$). Each of the next $n - 1$ lines contains two integers u_i and v_i ($1 \leq u_i, v_i \leq n$; $u_i \neq v_i$) meaning there is an edge between nodes u_i and v_i .

The next line contains n integer numbers, the i -th of them corresponds to $init_i$ ($init_i$ is either 0 or 1). The following line also contains n integer numbers, the i -th number corresponds to $goal_i$ ($goal_i$ is either 0 or 1).

Output

In the first line output an integer number cnt , representing the minimal number of operations you perform. Each of the next cnt lines should contain an integer x_i , representing that you pick a node x_i .

Examples

input
10 2 1 3 1 4 2 5 1 6 2 7 5 8 6 9 8 10 5 1 0 1 1 0 1 0 1 0 1 1 0 1 0 0 1 1 1 0 1
output
2 4 7
