

## E. Game with String

time limit per test: 2 seconds  
memory limit per test: 256 megabytes  
input: standard input  
output: standard output

Vasya and Kolya play a game with a string, using the following rules. Initially, Kolya creates a string  $s$ , consisting of small English letters, and uniformly at random chooses an integer  $k$  from a segment  $[0, \text{len}(s) - 1]$ . He tells Vasya this string  $s$ , and then shifts it  $k$  letters to the left, i. e. creates a new string  $t = s_{k+1}s_{k+2}\dots s_ns_1s_2\dots s_k$ . Vasya does not know the integer  $k$  nor the string  $t$ , but he wants to guess the integer  $k$ . To do this, he asks Kolya to tell him the first letter of the new string, and then, after he sees it, open one more letter on some position, which Vasya can choose.

Vasya understands, that he can't guarantee that he will win, but he wants to know the probability of winning, if he plays optimally. He wants you to compute this probability.

Note that Vasya wants to know the value of  $k$  uniquely, it means, that if there are at least two cyclic shifts of  $s$  that fit the information Vasya knows, Vasya loses. Of course, at any moment of the game Vasya wants to maximize the probability of his win.

### Input

The only string contains the string  $s$  of length  $l$  ( $3 \leq l \leq 5000$ ), consisting of small English letters only.

### Output

Print the only number — the answer for the problem. Your answer is considered correct, if its absolute or relative error does not exceed  $10^{-6}$ .

Formally, let your answer be  $a$ , and the jury's answer be  $b$ . Your answer is considered correct if

### Examples

<b>input</b>
technocup
<b>output</b>
1.0000000000000000

<b>input</b>
tictictactac
<b>output</b>
0.3333333333333333

<b>input</b>
bbaabaabbb
<b>output</b>
0.1000000000000000

### Note

In the first example Vasya can always open the second letter after opening the first letter, and the cyclic shift is always determined uniquely.

In the second example if the first opened letter of  $t$  is "t" or "c", then Vasya can't guess the shift by opening only one other letter. On the other hand, if the first letter is "i" or "a", then he can open the fourth letter and determine the shift uniquely.
