

B. Before an Exam

time limit per test: 0.5 second
memory limit per test: 64 megabytes
input: standard input
output: standard output

Tomorrow Peter has a Biology exam. He does not like this subject much, but d days ago he learnt that he would have to take this exam. Peter's strict parents made him prepare for the exam immediately, for this purpose he has to study not less than $minTime_i$ and not more than $maxTime_i$ hours per each i -th day. Moreover, they warned Peter that a day before the exam they would check how he has followed their instructions.

So, today is the day when Peter's parents ask him to show the timetable of his preparatory studies. But the boy has counted only the sum of hours $sumTime$ spent him on preparation, and now he wants to know if he can show his parents a timetable $schedule$ with d numbers, where each number $schedule_i$ stands for the time in hours spent by Peter each i -th day on biology studies, and satisfying the limitations imposed by his parents, and at the same time the sum total of all $schedule_i$ should equal to $sumTime$.

Input

The first input line contains two integer numbers $d, sumTime$ ($1 \leq d \leq 30, 0 \leq sumTime \leq 240$) — the amount of days, during which Peter studied, and the total amount of hours, spent on preparation. Each of the following d lines contains two integer numbers $minTime_i, maxTime_i$ ($0 \leq minTime_i \leq maxTime_i \leq 8$), separated by a space — minimum and maximum amount of hours that Peter could spend in the i -th day.

Output

In the first line print YES, and in the second line print d numbers (separated by a space), each of the numbers — amount of hours, spent by Peter on preparation in the corresponding day, if he followed his parents' instructions; or print NO in the unique line. If there are many solutions, print any of them.

Examples

input
1 48 5 7
output
NO

input
2 5 0 1 3 5
output
YES 1 4
