

## C. Ice Skating

time limit per test: 2 seconds

memory limit per test: 256 megabytes

input: standard input

output: standard output

Bajtek is learning to skate on ice. He's a beginner, so his only mode of transportation is pushing off from a snow drift to the north, east, south or west and sliding until he lands in another snow drift. He has noticed that in this way it's impossible to get from some snow drifts to some other by any sequence of moves. He now wants to heap up some additional snow drifts, so that he can get from any snow drift to any other one. He asked you to find the minimal number of snow drifts that need to be created.

We assume that Bajtek can only heap up snow drifts at integer coordinates.

### Input

The first line of input contains a single integer  $n$  ( $1 \leq n \leq 100$ ) — the number of snow drifts. Each of the following  $n$  lines contains two integers  $x_i$  and  $y_i$  ( $1 \leq x_i, y_i \leq 1000$ ) — the coordinates of the  $i$ -th snow drift.

Note that the north direction coincides with the direction of  $Oy$  axis, so the east direction coincides with the direction of the  $Ox$  axis. All snow drift's locations are distinct.

### Output

Output the minimal number of snow drifts that need to be created in order for Bajtek to be able to reach any snow drift from any other one.

### Examples

input
2 2 1 1 2
output
1
