

## A. Complicated GCD

time limit per test: 1 second

memory limit per test: 256 megabytes

input: standard input

output: standard output

Greatest common divisor  $GCD(a, b)$  of two positive integers  $a$  and  $b$  is equal to the biggest integer  $d$  such that both integers  $a$  and  $b$  are divisible by  $d$ . There are many efficient algorithms to find greatest common divisor  $GCD(a, b)$ , for example, Euclid algorithm.

Formally, find the biggest integer  $d$ , such that all integers  $a, a + 1, a + 2, \dots, b$  are divisible by  $d$ . To make the problem even more complicated we allow  $a$  and  $b$  to be up to googol,  $10^{100}$  — such number do not fit even in 64-bit integer type!

### Input

The only line of the input contains two integers  $a$  and  $b$  ( $1 \leq a \leq b \leq 10^{100}$ ).

### Output

Output one integer — greatest common divisor of all integers from  $a$  to  $b$  inclusive.
