

## C. Almost Arithmetical Progression

time limit per test: 1 second

memory limit per test: 256 megabytes

input: standard input

output: standard output

Gena loves sequences of numbers. Recently, he has discovered a new type of sequences which he called an almost arithmetical progression. A sequence is an *almost arithmetical progression*, if its elements can be represented as:

- $a_1 = p$ , where  $p$  is some integer;
- $a_i = a_{i-1} + (-1)^{i+1} \cdot q$  ( $i > 1$ ), where  $q$  is some integer.

Right now Gena has a piece of paper with sequence  $b$ , consisting of  $n$  integers. Help Gena, find there the longest subsequence of integers that is an almost arithmetical progression.

Sequence  $s_1, s_2, \dots, s_k$  is a subsequence of sequence  $b_1, b_2, \dots, b_n$ , if there is such increasing sequence of indexes  $i_1, i_2, \dots, i_k$  ( $1 \leq i_1 < i_2 < \dots < i_k \leq n$ ), that  $b_{i_j} = s_j$ . In other words, sequence  $s$  can be obtained from  $b$  by crossing out some elements.

### Input

The first line contains integer  $n$  ( $1 \leq n \leq 4000$ ). The next line contains  $n$  integers  $b_1, b_2, \dots, b_n$  ( $1 \leq b_i \leq 10^6$ ).

### Output

Print a single integer — the length of the required longest subsequence.

### Examples

input
2 3 5
output
2

input
4 10 20 10 30
output
3

### Note

In the first test the sequence actually is the suitable subsequence.

In the second test the following subsequence fits: 10, 20, 10.
